

## If a HEMP hits over Europe or U.S.A. and destroys all electricity

There are a number of houses burning after the HEMP, so be fast and try with CO2 fire extinguisher. But if it runs out, then water as long as there is pressure. It is a hassle and we can only guess how many houses will burn down.

When the fire is out, do not under any circumstances put external power on the wires. Pull the main electrical switch, so if an idiot put a generator on the grid, it will not cause electricity in your electrical wires.

Save your cats and dogs and get them temporarily out of the house. If a person with pacemaker is dead, there is no hope for him or her. If a leg or an arm moves electronically and now does not work, see if you can get the person to the hospital. They can maybe do something like close the leg in one position so you can walk.

## Prepare the absolutely needed

### **Water**

Rain water is marvelous. If you have a roof of bricks then you are safe. Aluminum roof you will probably need to clean for drinking and food making. Steel is fine and okay. Do not collect water from roofs that sends micrometer scale dust out.

A well is super. You can lower a pale down to where the water is. Make sure there is some weight in the pale if it is made of plastic. Even though the well is electric, try the pale so you do not have a surprise after blackout.

A stream is also good, but you have to clean the water, even for nano things in order to use it for drinking, cook food and do bathroom washing.

A lake is more or less the same thing as a stream, but be very careful with filtration and cleaning.

If you are **not** near a well, stream or lake, you will have to use some plastic 10 to 25 liter cans. You must exchange the water once a week. You must be very careful and do not waste water on washing. Save it for drinking, coffee, tea and eventually water for dried food. It can take weeks before you find a well, stream or lake to collect water in your tanks.

## ***Food***

If you haven't bought some long durability food products, then plan for the coming year right now. Buy as much you can afford and the things you like. Normally ten-cans can last many years. Honey in a real glass can last a year or five. Dried food in special wrapping can normally last 25 years and you can try it beforehand to see if you like it. Try to get as local as possible, no GMO "vaccinated" and a company you trust.

## ***Pills and medicine***

You cannot "phone" a doctor to "order pills or medicine". See if the pharmacy is open and get the pills and medicine. It will be difficult.

## **Needed stuff**

### ***Transport***

If you are lucky there is some diesel cars, trucks and busses where there is no electricity in the diesel engine. They are maybe older than 1985 and they can mostly start. There is plenty of fuel in the diesel vehicles after year 2000, so go and drain a car. You can get some plastic pump thing, so you avoid getting diesel in your mouth. You will have to ask the owner if he wants to drive you.

All bicycles will work.

All horses can work between 2 hours and 6 hours a day, depending of their workload. Use easy tempo to start with and easy tempo to finish, for the mussels to come in form. If there is no grass where you stop for a while, have a bag with some food, eventually with a strap over the horses head. It is not so easy to ride a horse, but you will learn. It is practical and you can ride it in snow better than you ride a bicycle.

### ***Electricity***

Things with no wires attached may work. So you could have generator with no wires attached or a solar panel also with no wires.

The generator is the easiest to use. If you have an incandescent bulb, you can try if the generator works. Assuming that it works, try the kitchen machines in the drawers. Those machines lying in a drawer has a good chance of working. If your house has incandescent bulbs, you can try them one by one. If you have a lamp where the wires are okay, you can insert the bulb and have an electric light.

Pumps are not likely to work. But let's try them out. Remove the wires from the wall. If it is a 3-phase and your generator has a 3-phase plug, you are okay to try it out. If it is 1-phase, put it in the generator's 1-phase outlet.

Motors are used for different things, but one thing comes first: Motor and pumps for the well. The pump is working, so if you can attach the engine to the pump you are good. To save electricity you can pump the hydro-for tank twice a day. It is a big task, so let me take the time it takes, because the rotating things have to be perfectly aligned.

## **Radio**

Your battery shortwave radio is good to listen to. See if you can find a station speaking your language. Most shortwave radios can also take medium wave and long wave, but they are not used very much anymore. FM-radio is very unlikely you can hear anything on.

Store the shortwave radio in the metal box or EMP/Faraday safe bag before the HEMP.

The HAM/armature/PMR/SRBR radio is the way to talk to locals. For locals within a few kilometers the frequency range is 440-460 MHz. For locals within around 10 km the frequency range is 144-148 MHz. You can maybe agree locally what radio is most geared for the purpose and remember to put it back in the metal box or EMP/Faraday safe bag before the HEMP.

Satellite phones can maybe be used.

You can phone other satellite phones, but you need to know the number beforehand, so arrange that tomorrow and put it back in metal box or EMP/Faraday safe bag before the HEMP.

## **Farmers**

Cows, sheep and chickens need good water. Mostly a stream is okay.

Arrange with some farmers. There are enough to do on the farm, so they desperately need some help. Milking the cows and making it nice for them. Chickens need a bit of help too. Much of the year the fields need a lot of work. If the farmer cannot get horses and a little plow, then a lot of you need to sort out the earth mechanically.

Every one needs a for carrying milk home.

Eggs go in one of your egg things from earlier. I guess they can last 20 times, so will need some other stuff to carry eggs.

Some of you will have to guard the area, preferably with rifles, guns and machine guns. The luring and destroying wall happen fast. Patrol at least four grown men, it is very important. This has to be arranged very fast and divided in schedules like 6 hours of work in 4 turns. You need the patrols going so close that they can see each other and come to help if they are many. If the food is gone, so are you. Children must stay inside after darkness and should not play outside the property where the parent are resided.

## **Self-farmers**

Plants demand water, not clean water.

If you have peace of earth in house or surrounded with bricks, you might have your harvest in peace.

## **Schools**

It will be a different kind of school, completely different.

Within a month elect some teachers. It could be 10 students and 100 students. There will be different ages that the teachers has to take care of. Main subjects: Native language, calculation, geography, biology and learn about the nature by walking there. Youngsters have more IQ som they can possibly teach each other too. They cold go in school for 4 hours, then they cold go home and eat. Bringing food to the school or distributing food at school is not a good idea, the food means robbery or killing.

District guards

Within one month you must have selected men and women to guard a district. They should go four in a patrol at least in the night time. Be armed if possible. Shout if the enemy appear mysteriously or they come in overwhelming quantities. It is out of the bed and help the shouting guards. If you arms then carry it. You must kill the intruders before they kill you. It will majorly be city folks violating your area, because they are in a terrible need. But you will die so the invaders can live a little longer. So always carry a pistol or a slingshot and a knife. The knife comes in when the invader is down on the ground, you can the kill hin or her with the knife.

If one of your own turn against you, you will throw him or her out and if he or she does not do it, kill.

There will be 75-90% suffering death within a year. So what you have is worth taking care of so you can survive. As long as the children play, the grown ups do their tasks and the elderly make food for the children and grown ups, you will survive.

The Mafia (government, military, law, police) dos not exist, gone.

You can within a year recover the hospitals. New wires, new generators, new lamps, new medical machinery, new cleaning equipment for tools, new linin washing/drying machines, etc. It all may be supported by aircraft as roads are still not passible. Hospital can then help with broken limbs, gunshots, deep knife cuts, etc.

It is still a question about the money for equipment from a far away country. Can we provide gold enough to get the hospital refurbished? The only thing we do not need is the Chines or the Russians to invest in our country by demanding full slavery.

## **Money**

It will take some years to get silver ad gold coins running. But until then we just help each other. It is something the farmer is still a little used to, but we all need to do it this time. The banks has been in charge since 1913 and before that the landowner.

## **Local governess, my opinion**

Within one year we should elect a non Jewish to be Mayer for one year 4 times reelected if he or she is reelected. So the Mayer can only sit there for 4 years in total.

The Mayer elects staff and sherif. The sherif can sit in that position for 4 years only.

The area covered could be 20km to 200km depending on the density.

The Mayer has the final word.

A repeater, 144MHz to 148MHz is set op on a mast and a generator. The repeater is broadcasting, inter links for other regions, so keep away from the repeater on local talk. If we can handle it economically, then we could have a couple of repeaters using 440-460MHz.

The sheriff will resolve disagreement between folks. So within there is a Mayer and he elects a sheriff that can resolve owner of material. If it is an item stolen, then he must give back 3 times as much or similar, what ever the sheriff thinks plausible.

The sheriff will put some men and women to set aside car and trucks to the side so horses, bicycles and old diesel trucks and diesel cars can pass the road. Truck and busses can be moved by big hand winches with big anchors. For a truck you possibly need 10 winches and 10 anchors. Cars can normally lifted by 8 big folks, but be careful with your body.

There could be dead people in the street. If possible try to bury them I the side of the road. If a big airplane black the road, then see if you can take a detour around. There will be millions of big and small peaces, so it will impossible to make the road passible.

### ***Nuclear power***

Nuclear power needs cooling, apposite tor power that you just put the whole thing down the earth tanh and pull it up again if you want to produce power.

The cooling of uranium must go on. The most acute problem is to get generators wire and generator/pumps flown in as fast as possible to all nuclear stations.

As the year passes we could build some some small nuclear power stations, 20-100 MW located everywhere.

### ***Other electrical power sources***

All windmills are gone, all of them.

All coal power stations are gone, aa of them.

All gas powered stations are gone, all of them.

Earth power stations can likely pe rebuilt.

Solar panels are few that are working, but those that do can upload accumulators, but be careful not to overload them, and store the accumulators in a separate ventilated room.

Waterwheel can be handy for a little light and charging you batteries. One bicycle wheel with about 10 glass bottles and a generator can produce around 20 to 50 kw. You might place it in a separate room, because of the noise. If you find such an electric motor that is working the voltage is depended of whether to drive "net" ac or with lover voltage DC to upload accumulators.

### ***Details about radios***

The armature radio is solid clientele, but that a little later.

For those who have farming radios, hunting radios and other radios you can assist each other and just have nice time. You can on some send messages, SMS, maybe twice a long distance. It is best to have one channel you call each other, then switch to an empty channel. You can play bingo on one channel and chess on another. It can be a bit cloudy if there occasionally are many hunters with radios, so be polite.

144.000 MHz to 146.000 MHz is standard from 1970 and on words among the radio armatures. There is no authority so everyone can use all the frequencies. I have an AnyTone D878UVII that master the 144.000 to 148.000 and 440.000 to 460.000 MHz, VHF and UHF. Radios can in general not go far unless the antenna is raised to the roof or some higher point. UHF is a small antenna, so you put that antenna over the roof and a cable down to the sitting room and a plug into the radio.

So cable and plugs and a couple of radios you need to order in a radio shop or similar. The antenna should be either for 146 MHz or for 450 MHz (or both). Order it soon. Each radio cost \$30 to \$300 depending of what quality you are after. If you are rich you could also buy a stationary for 12 V with a 50 W output.

Remember, radio is the only way to communicate and maybe satellite phone. With radio it does not cast anything at all. We really need to talk, even if it is only people in vicinity. The satellite phone is also a fine thing to call your mom in anther country, but you have to have her satellite number very soon and make an agreement that you are calling her under open sky by a certain time. If you are paying for the phone and deliver it to her, make sure you pay monthly or yearly fee for the phone.

When I am doubtful that it works after a HEMP then it is because you cannot pay the phone and maybe the HEMP is slaughtering many satellites so communication will be limited. When both of you are under open sky, then make the conversation short as you only have limited conversation or SMS.

Put your radios and telephones down in a metal box with no paint between box and the lit. The army are good and you can have a very big size for bombs or a small one for pistol ammunition. You can have a mm wave or EMP/Faraday style soft bag to put radios and satellite phones in.

You can take the radios out of the bag temporarily, but remember to put them back in a box or bag again. You can mount the cable as it is not connected to anything, just make sure it is no way other wires as they might get warm or in worst case burn.

You are most likely to have 12 V via accumulator and little generator or a non connected solar panel from earlier, before the HEMP. So make sure you have a charging aggregate for 12 V that can charge elements of AA and AAA batteries. You can get a 12 V to USB 5 V in almost any store. If you are so lucky to have a MPPT module with no connection, then try to see if it function. Then you can easily charge your accumulator via one or two solar panels.

### ***Photo cameras***

Photo cameras will normally work, so take some pictures. There will come a day where you can get a new laptop at store the pictures. I have a Sony 6100 that I am using every day. I do believe that it will survive a HEMP because it very compact and no connection with external wires. It can take 1000 pictures in full format. That is fine for me within a year or two.

### ***Mobile phones***

Mobile phones may work also as photo camera. Read the things you need to read, put it off and lay it in drawer. It may still every 5 seconds try to take a picture and send it to the authorities. But it will run out juice after some time. If there is a possibility to take the battery out, then do so.

In some years, or 10 years, you will get use of it again.

### ***Washing machine***

If you have power enough, then you can load the cold water via a container on a stage over the washing machine. It gives 0.25 bar and should be enough, otherwise you must lift the container one stock higher up, so you get 0.5 bar down by the washing machine. If the washing machine connected at the HEMP it is likely it does not work.

## ***Written paper***

The paper without electricity has past away for nearly 60 years, it is not possible to get anything now, even in countries with electricity. Apart from writing 1000 A4 with the same text in hand, is to get a laser printer together with a laptop flown in. As the powder only lasts 5000 to 10000 pages, it is best to get a number of patrons. Normally you would put a wire from the printer to switch and from the switch to the laptop/desktop, but can connect the printer directly to the laptop/desktop. Order also 50.000 pages unless you have plenty.

I do not know how you would pay the airliner and the, the laser and the laptop/desktop.

It will give a chance to inform the local community with news, election, public meetings, etc.. You can select some persons to distribute the messages to the houses. Long-john bicycle would be preferable, but any bicycle with room for 100 to 500 pieces of papers.

## ***Service***

As the time goes by we should be able to do some service a number of hours a week as carpenters, as blacksmith, as detritions, etc..

Although the farms need a lot of people, there must be time for a professional to do the work especially for the elderly. Even without machines you can do every thing in a house, except drilling hole in concrete walls.

We need some to repair bicycles. Need some to put new shoes on horses.

Auto mechanic taking diesel busses, trucks and cars with little electronics, change bulbs, relays and eventual change some wires. It may only take a week per car with mechanics only working a day. Switch of the airbag if any. Switch all sorts of automated brake systems of, mount the pipes or hoses from each wheel to the brake cylinder or brake pedal assembly. Exchange the generator if needed and the start motor, except on air pressure starter. Please do everything you can think of to make them secure and good.

Lots of road workers for a day of the week. We need to get cars, trucks and busses nice to the side of roads. Collect garbage. Plant some flowers. And so on...

## ***Production***

Production could also use people a number of hours a day. We need candlelight, "toilet paper", soap, trouser in/out, sweaters, wool handling, cut the nails on sheep, cut wood, ...

## ***People not from western society***

The west is individuals, the Africans and Asians have a tribe culture.

The tribes go together in large numbers, the Westerners goes two together. When we have Africans invading the country in large numbers, they can assemble to get rid of Westerners.

If blackout had happened before 11<sup>th</sup> March 2020, there would only be few non-westerns and they would fine in society. But after open borders and war against the Mafia (government, military, law, police) the foreign people is a danger. That is why the farms must be protected by a lot of westerners.

The westerners where HEMP did not happen and current flowing, is or will become tribal non-white countries. I am 72 and not afraid of being killed, but I am sorry about the slightly younger people. It is sad that there is so little vikings in us, that we cannot assemble like the African tribes do. As a lone wolf you will soon be out of the game.

The military is part of the Mafia and it much stronger and way more technical / modern than the people – with electrical current. But after a HEMP they will pay very little role. Therefore in way I hope for an HEMP where I live. It is the only thing that can stop chem-trails, WiFi, mobile radios, ca. 80% total tax, the Mafia and so on. During an HEMP we will have a chance of winning over the invaders.

Part of this chapter is from Michael Yon as was interviewed by Maria Zee.

## How a HEMP work

Lat us say that the Russians shot a rocket up with the nuclear device, HEMP. The will shot it over the atmosphere and let it explode over, lets say, U.S.A.. There will be no dilemma regarding pollution, but a gigantic electronic mayhem.

## Some pictures

Lamp oil under pressure. It gives about 75 to 100 W output and can burn about 6 hours. You will need extra net and a lot of lamp oil.

Generator in an iron shelter. External wire are first connected after a HEMP or during normal blackout. Even the starter battery is not connected although we are in an iron shelter. It may be worth investigate I such a generator, if you are floating with money.

END
